The Fudan-UC Dispatch is a periodic publication by the Fudan-UC Center on Contemporary China, based at the University of California (UC) San Diego’s School of Global Policy and Strategy (GPS). It features current research publications on China in digest form as well as noteworthy commentaries on current affairs related to China by UC and Fudan University scholars. Its purpose is to enhance publicity for UC and Fudan scholars publishing in the China area and to familiarize these scholars with each other’s research interests so as to identify future collaborative opportunities. The Fudan-UC Dispatch sources its information in English only. It also includes a brief section on the Fudan-UC Center activities.

Table of Contents:

Fudan and UC Scholars’ Research on China..... 1-8

Fudan and UC Scholars in the News 9-14

Fudan-UC Center Events..... 15

About the Fudan-UC Center:

The Fudan-UC Center on Contemporary China creates opportunities for cooperation between Fudan University and all UC campuses on research, policy and educational initiatives, including academic conferences and community events. It is the first overseas research center established by a Chinese university at a North American university. Based at GPS, the center also works closely with the School’s 21st Century China Center. Learn more at fudan-uc.ucsd.edu.

How did land reform and collectivization reshape China's rural–urban relations?

Based on archival materials, this article examines Land Reform and Collectivization in 1940s and 1950s from the viewpoint of rural–urban relations. It argues that there were various strong ties between rural society and urban society in traditional China. However, the programs of Land Reform and Collectivization cut off these ties and made it impossible for Chinese people to be “amphibious” as they were previously. This fundamental change reshaped China's rural–urban relations, making rural society and urban society two separate spheres. The new rural–urban relations lasted all the way down to the present without being overhauled.

How did China's WTO entry benefit U.S. consumers?

China's rapid rise in the global economy following its 2001 WTO entry has raised questions about its economic impact on the rest of the world. In this paper, we focus on the U.S. market and potential consumer benefits. We find that the China trade shock reduced the U.S. manufacturing price index by 7.6 percent between 2000 and 2006. In principle, this consumer welfare gain could be driven by two distinct policy changes that occurred with WTO entry. The first, which has received much attention in the literature, is the U.S. granting permanent normal trade relations (PNTR) to China, effectively removing the threat of China facing very high tariffs on its exports to the U.S. A second, new channel we identify is China reducing its own input tariffs. Our results show that China's lower input tariffs increased its imported inputs, boosting Chinese firms' productivity and their export values and varieties. Lower input tariffs also reduced Chinese export prices to the U.S. market. In contrast, PNTR had no effect on Chinese productivity nor export prices, but did increase Chinese entry into the U.S. export market. We find that at least two-thirds of the China WTO effect on the U.S. price index of manufactured goods was through China lowering its own tariffs on intermediate inputs.

Climate and crop yields in Australia, Brazil, China, Europe and the United States

We examine whether nonlinear relationships between climatic conditions and crop yields are globally generalizable at subnational levels. We match subnational longitudinal administrative data on crop yields for barley, maize, oats, rice, soybeans and wheat with growing season temperature and rainfall measures across Australia (n=406), Brazil (n=94,299), China (n=38,480), the European Union (n=15,505) and the United States (n=177,069). Using a flexible nonparametric approach that accounts for unobserved differences between locations, we estimate nineteen separate nonlinear climate-yield response surfaces. We verify that high temperatures and low rainfall substantially and significantly reduce crop yields across essentially all contexts and crops, with the exception of rice which tends to display more muted effects. Our results demonstrate a large and generalizable sensitivity of crop yields to climatic conditions across major crops in many of the world's most productive agricultural regions.

The current wave of state enterprise reform in China: a preliminary appraisal

State enterprise reforms are underway in China, and include some positive and overdue corporate governance reform. However, the potential effectiveness of the reforms is compromised by the attempt of policy-makers to achieve three goals which form an "impossible trinity": increase firm autonomy; improve oversight; and assign new developmental missions to state firms. The goal of assigning new developmental missions to state firms is reflected in the design of new state investment companies which are intended to gradually take over ownership functions from existing agencies. The structure and function of the new ownership agencies undermines the potential of the corporate governance reforms at the enterprise level. These contradictions will be costly because state firms will likely be ineffective in carrying out developmental missions—particularly technology innovation—while also failing in the enterprise reform goal of becoming more efficient and profitable.

How global is the common law? A comparative study of Asian common law systems – Hong Kong, Malaysia and Singapore

This article compares three common law jurisdictions in Asia – Hong Kong, Malaysia and Singapore. By studying the use of foreign citations in the reported opinions of these jurisdictions, we show that they have acquired a judicial character that is distinctively outward-looking and global. The variety and range of foreign citations suggest that the phenomenon cannot be fully explained as a matter of colonial legacy. The article further discusses the ways in which the use of foreign case citations serve as a means for legal and professional enrichment.

Preventing protest one person at a time: psychological coercion and relational repression in China

Using riot police to break up a big demonstration is a familiar occurrence in many parts of the world, including China. But all protest control does not involve the use of force, nor is repression always directed at large groups of people assembled in one location. Some repression rests on psychological rather than physical coercion and is aimed at individuals, often in their homes or nearby. This type of repression may be carried out by people with only a loose connection to the state's coercive apparatus, such as relatives, friends or neighbors of the target who work for the government or receive benefits from it. "Relational repression" is labor intensive and a sign of a high-capacity state that uses multiple levers to suppress contention, but has limited reach and remains insecure about its ability to maintain social stability. It builds on Maoist and dynastic techniques of control and aims to extend state penetration into a marketized society whose members have increasingly emancipated themselves from direct dependence on the government. Relational repression often alienates both the agents of repression and their targets. But it can, at times, be effective in demobilizing resistance or preventing a person from taking part in protest.

Mass digitization of Chinese court decisions: how to use text as data in the field of Chinese law

Over the past five years, Chinese courts have placed tens of millions of court judgments online. We analyze the promise and pitfalls of using this remarkable new data source through the construction and examination of a dataset of 1,058,990 documents from Henan province. Courts posted judgments in roughly half of all cases in 2014 and, although the percent of cases posted online has likely risen since then, the single greatest challenge facing researchers remains documenting gaps in the data. We find that missing data varies widely by court, and that intermediate courts disclose significantly more documents than basic level courts. But court level, GDP per capita, population and mediation rates are insufficient fully to explain variation in disclosure rates. Further work is needed to better understand how resources and incentives might be skewing the data. Despite incomplete information, however, a topic model of 20,321 administrative court judgments demonstrates how mass digitization of court decisions opens a new window into the practice of everyday law in China. Unsupervised machine learning combined with close reading of selected cases reveals surprising trends in administrative disputes as well as important research questions. Taken together, our findings suggest a need for humility and methodological pluralism among scholars seeking to use large-scale data from Chinese courts. The vast amount of incomplete data now available may frustrate attempts to find quick answers to existing questions, but the data may excel at opening new pathways for research and at adding nuance to existing assumptions about the role of courts in Chinese society.

Discussion Paper No.
10924Co-author: Dennis
Tao Yang**Offshoring and wage inequality: theory and evidence from China**

We present a global production sharing model that integrates the organizational choices of offshoring into the determination of relative wages in developing countries. The model shows that offshoring through foreign direct investment contributes more prominently than arm's length outsourcing to the demand for skill in the South, thereby increasing the relative wage of skilled workers. We incorporate these theoretical results into an augmented Mincer earnings function and test the model based on a natural experiment in which China lifted its restrictions on foreign ownership for multinational companies upon its accession to the World Trade Organization in 2001. Empirical findings based on detailed Urban Household Surveys and trade data from Chinese customs provide support to our proposed theory, thus shedding light on the changes in firm ownership structure, the skill upgrading in exports and the evolution of wage inequality from 1992 to 2008 in China's manufacturing sector.

(JFQA), Forthcoming**Do IPOs affect the market price? Evidence from China**

We examine whether sizable initial public offerings (IPOs) affect the whole market. Using a Chinese IPO sample, we find robust evidence that sizable IPOs do depress the market price on not only the listing day but also the offering (subscription) day. The impact on the market is negatively correlated with the IPO size on the listing day. However, the IPO impact is largely transitory. The China Securities Regulatory Commission (CSRC) often places a moratorium on IPOs to support the market, which seems ineffective as the negative IPO effect is transitory and moratoriums are not perceived as good news.

The face of internet recruitment: evaluating the labor markets of online crowdsourcing platforms in China

Zhubajie/Witmart and other online crowdsourcing platforms have proliferated in China and researchers have increasingly used them for subject recruitment. One critical question remains, however: what is the generalizability of the findings based on these online samples? In this study, we benchmark the demography of an online sample from Zhubajie to nationally representative samples and replicate commonly asked questions in national surveys. We find that online respondents differ from the general population in many respects. Yet, the differences become smaller when comparison is made with the internet users in benchmark surveys. Importantly, when predicting attitudes, our online sample is able to produce similar coefficients in most cases as these internet-active subsamples. Our study suggests that online crowdsourcing platforms can be a useful tool for subject recruitment, especially when researchers are interested in making inferences about Chinese netizens. We also analyze the political and social desirability issues and we discuss caveats.

Manipulating China's "minimum livelihood guarantee": political shifts in a program for the poor in the period of Xi Jinping

In 1999, the State Council set forth an urban social assistance program aimed chiefly at pacifying protesting laid-off workers and compensating for the breakdown of the work-unit-based welfare benefits that had obtained under the planned economy. While an initial goal was to ensure that political stability would allow enterprise reform to proceed unchallenged, over time the content of the scheme shifted in line with new regime goals. First the program spread to the countryside, as the New Socialist Countryside model was installed. In the past few years, in line with a tightening of financial commitment, leaders have demanded that the able-bodied poor should work, not be succored and that the program's allowances target the desperate. Also, beginning in 2014 and continuing into 2016 there has been heavy emphasis on fighting graft and corruption in the program. The paper details five alterations that have emerged - or policy slants for which earlier, less extreme changes in implementation have intensified - since Xi Jinping ascended to power. The big message here is that the regime has repeatedly reshaped this initiative to match the changing political agenda of the Party.

Do city–county mergers in China promote local economic development?

Municipal mergers have become a worldwide phenomenon in the past few decades, primarily advanced to exploit economies of scale. While most evaluations of municipal mergers have focused on the efficiency of local public goods provision, it is rare in the literature to explore how such mergers promote economic growth in a developing country context. This research investigates the economic consequences of a policy experiment of city–county mergers (che xian she qu) in China during the period 2000–2004. Using comprehensive datasets at city, county and firm levels, we present evidence that the merger significantly increases local economic development and that the magnitude of the effect depends on local endowments related to agglomeration forces. The results are robust to a number of different model specifications. We further verify that improved transport infrastructure and urban agglomeration economies after merger are potential contributors to the positive merger effects.

Local governments' fiscal pressure and the dependence on polluting industries in China

Using a large, unique county-level panel dataset for China from 1998 to 2006, this paper investigates the relationship between local governments' fiscal pressure and their preference for developing polluting industries. The results show that fiscal pressure effects exist; namely, a positive link between the fiscal pressure faced by a county and its industrial tax dependence on polluting industries. We also investigate the heterogeneity of the fiscal pressure effects and find that fiscal pressure effects are significant only when local fiscal pressure is sufficiently high up to a certain point, and when there are more earmarked transfers. In contrast to the situation in east China, fiscal pressure effects in central and west China are more pronounced. Therefore, when dealing with environmental problems, policymakers need to take local governments' fiscal conditions into account.

Hong Kong and Shanghai, 1987–2017: a convergence, a reversal and two ironies

The author provides a critical comparison of Hong Kong and Shanghai based on time spent at both cities between 1987 and 2017. He projects a pessimistic future for the former British colony, summarising his reasons in two ironies, namely: 1) “many things that made Hong Kong very different from Shanghai thirty years ago have disappeared -- but sometimes because of the way the latter city, not the former one, has changed,” and 2) “some things that made the places as I first encountered them different in the 1980s remain -- but with Hong Kong and Shanghai having switched places.”

Urban spatial structure and motorization in China

Using data from 161 Chinese cities, this paper investigates the effects of various dimensions of urban spatial structure on the ownership and commute mode split of automobile. Results confirm the positive effects of city size on auto ownership and mode split and the negative effect of density on auto ownership. Echoing a small number of studies, this research discovers the seemingly counterintuitive effect of jobs-housing balance on the use of automobiles, probably due to the potential advantage of public transit relative to driving in dense and congested Chinese cities. Cities should emphasize public transit and maintain density in the future.

China state-owned telecom privatisation seen as too timid

Shares in state-owned China Unicom, the country's second-largest telecom carrier, initially soared more than 11 per cent on the back of the company's announcement last week that it plans to sell \$12bn in equity to outside investors in the country's largest privatisation deal in at least a decade. But some investors and analysts doubt that the private group investment will fundamentally alter Unicom's character as a state-controlled actor that must balance profit-seeking against support for government policy. Naughton agrees that the performance of mixed ownership so far has been disappointing, but thinks Unicom could be different because of the group's history.

Dingli Shen

Fudan University

Field: Political Science

Source: Outlook India

Date: Jul 17, 2017

'Modi And Xi increasingly do not trust each other. This is not a constructive development.'

On the recent military stand-off at Doklam, Shen remarks in an interview that while the possibilities of war is unlikely, the growing distrust between China and India is "not a very constructive development to work together to build a new Asian century."

Shen discounts India's charge that the Chinese have intruded upon India's territory. Doklam is a disputed area "between China and Bhutan, not between China and India. Between China and Sikkim (now India), there is no dispute over this place at all -- India accepts that it belongs to China," he says. "So when India gave up its argument, that China intruded into India, and picked up another argument that this place belongs to Bhutan, China considers such a scheme as insincere. Between China and Bhutan, Bhutan has the right to disagree with China. However, before Bhutan expressed its disagreement, Indian armed forces had already entered the place that India considers belonged to China, while accusing China of invading India."

China builds its global role, one infrastructure loan at a time

The China-led Asian Infrastructure Investment Bank has announced at its second annual conference that it could boast a loan book of \$2.5 billion, capped by new projects in India, Georgia and Tajikistan. It has also approved Argentina, Madagascar and Tonga as members at the conference. The bank expects to double its lending in the next five years, with \$6 billion to \$7 billion of projects in the pipeline already. Zhu thinks that AIIB "is a good case study where China can have a leadership role without dominating the institution." Still, AIIB has a political dimension and "massive infrastructure building in Asia sponsored by a China-led development bank necessarily enhances China's regional clout."

"Mr. Deng Goes to Washington"

Nov. 20, 2016, UC San Diego | Register

This riveting documentary tells the story of Deng Xiaoping's historic visit to the U.S. in 1979 that changed the trajectory of U.S.-China relations and the world. The film screening will be followed by conversation about the historical role of Deng and U.S.-China relations post-election.
